Accordingly, the 8-phenyl-6,9-dihydro-[1,2,4]triazolo[3,4-i]purin-5-one derivatives of the invention and pharmaceutically acceptable salts thereof, and pharmaceutical compositions comprising such compound and/or salts thereof, may be used in a method of treatment of disorders of the human body which comprises administering to a patient requiring such treatment an effective amount of a 8-phenyl-6,9-dihydro-[1,2,4]triazolo[3,4-i]purin-5-one derivative of the invention or a pharmaceutically acceptable salt thereof.

The present invention also provides pharmaceutical compositions which comprise, as an active ingredient, at least a 8-phenyl-6,9-dihydro-[1,2,4]triazolo[3,4-i]purin-5-one derivative of formula (I) or a pharmaceutically acceptable salt thereof in association with a pharmaceutically acceptable excipient such as a carrier or diluent. The active ingredient may comprise 0.001% to 99% by weight, preferably 0.01% to 90% by weight of the composition depending upon the nature of the formulation and whether further dilution is to be made prior to application. Preferably the compositions are made up in a form suitable for oral, topical, nasal, rectal, percutaneous or injectable administration.

The pharmaceutically acceptable excipients which are admixed with the active compound, or salts of such compound, to form the compositions of this invention are well-known per se and the actual excipients used depend inter alia on the intended method of administering the compositions.

Compositions of this invention are preferably adapted for injectable and per os administration. In this case, the compositions for oral administration may take the form of tablets, retard tablets, sublingual tablets, capsules or liquid preparations, such as mixtures, elixirs, syrups or suspensions, all containing the compound of the invention; such preparations may be made by methods well-known in the art.

The diluents which may be used in the preparation of the compositions include those liquid and solid diluents which are compatible with the active ingredient, together with colouring or flavouring agents, if desired. Tablets 5 or capsules may conveniently contain between 2 and 500 mg of active ingredient or the equivalent amount of a salt thereof.

The liquid composition adapted for oral use may be in the form of solutions or suspensions. The solutions may be 10 aqueous solutions of a soluble salt or other derivative of the active compound in association with, for example, sucrose to form a syrup. The suspensions may comprise an insoluble active compound of the invention or a pharmaceutically acceptable salt thereof in association 15 with water, together with a suspending agent or flavouring agent.

Compositions for parenteral injection may be prepared from soluble salts, which may or may not be freeze-dried and which may be dissolved in pyrogen free aqueous media 20 or other appropriate parenteral injection fluid.

Effective doses are normally in the range of 10-600 mg of active ingredient per day. Daily dosage may be administered in one or more treatments, preferably from 1 to 4 treatments, per day.

25 The syntheses of the compounds of the invention and of the intermediates for use therein are illustrated by the following Examples (including Preparation Examples (Preparations 1-37)) which do not limit the scope of the invention in any way.

30 ^1H Nuclear Magnetic Resonance Spectra were recorded on a Varian Gemini 300 spectrometer. Low Resolution Mass Spectra (m/z) were recorded on a Micromass ZMD mass spectrometer using ESI ionization. Melting points were recorded using a Perkin Elmer DSC-7 apparatus. The chromatographic separations were obtained using a Waters 35 2690 system equipped with a Symmetry C18 (2.1 x 10 mm, 3.5 μm) column. The mobile phase was formic acid (0.4 mL),

ammonia (0.1 mL), methanol (500 mL) and acetonitrile (500 mL) (A) and formic acid (0.46 mL), ammonia (0.115 mL) and water (1000 mL) (B): initially from 0% to 95% of B in 20 min, and then 4 min. with 95% of B. The reequilibration time between two injections was 5 min. The flow rate was 0.4 mL/min. The injection volume was 5 μ L. Diode array chromatograms were collected at 210 nM.

PREPARATION EXAMPLES

10

PREPARATION 1

8-(2-Ethoxyphenyl)-6-ethyl-6,9-dihydro-[1,2,4]triazolo[3,4-i]purin-5-one

15 a) A solution of 2-ethoxybenzoyl chloride (12.0 g, 65 mmol) in dimethylformamide (10 mL) was added dropwise to a stirred solution of 5,6-diamino-1-ethyl-1*H*-pyrimidine-2,4-dione (10.4 g, 61 mmol) and triethylamine (9.8 mL, 65 mmol) in dimethylformamide (250 mL). The resulting mixture was stirred for 20 hours at room temperature, then 20 evaporated under reduced pressure. Aqueous sodium hydroxide solution (1N, 98 mL, 98 mmol) was added and the mixture heated under reflux for 6 hours. The resulting solution was acidified with 1N hydrochloric acid and the precipitate collected and dried by suction to give 8-(2-25 ethoxyphenyl)-3-ethyl-3,7-dihydropurine-2,6-dione as a beige solid (7.0 g, 72%).

30 b) Phosphorus pentasulphide (5.5 g, 12.4 mmol) was added portionwise to a stirred suspension of the above compound (7.0 g, 23.3 mmol) in pyridine (115 mL) and the resulting mixture stirred under reflux for 3 hours, then evaporated under reduced pressure. The residue was triturated with hydrochloric acid (2N, 100 mL) and the precipitate collected by filtration and dried under vacuum to yield 8-(2-ethoxyphenyl)-3-ethyl-6-mercaptop-3,7-dihydropurin-2-one (6.9 g, 95%) as a pale brown solid.

35 c) A stirred mixture of the above compound (6.9 g, 21.8 mmol) and hydrazine monohydrate (100 mL) was heated

to 130 °C for 3 hours. The resulting mixture was cooled and the precipitate collected by filtration and washed with water and ethanol, then dried under vacuum to yield 8-(2-ethoxyphenyl)-3-ethyl-6-hydrazino-3,7-dihydropurin-2-one (6.6 g, 97%) as an off-white solid.

5 d) A stirred mixture of the above compound (6.6 g, 21.0 mmol) and formic acid (110 mL) was heated under reflux for 2 hours. The resulting solution was concentrated under vacuum and the residue partitioned 10 between dichloromethane and aqueous sodium bicarbonate solution, then the organic phase separated, washed with water, dried ($MgSO_4$) and evaporated under reduced pressure to yield the title product (5.4 g, 79%) as an off-white solid.

20 PREPARATION 35

Azetidin-3-ylmethyldimethylamine, dihydrochloride

a) A solution of 1-(1,1-diphenylmethyl)azetidine-3-carbonitrile (7.8 g, 31.4 mmol) in 30 mL of tetrahydrofuran was slowly added to a suspension of lithium aluminium hydride (4.0 g, 105 mmol) in tetrahydrofuran under nitrogen and the resulting mixture was stirred under reflux for one hour. On cooling, the mixture was treated dropwise with water (4 mL), aqueous sodium hydroxyde (4 mL, 4N), and water (12 mL) and filtered. The filtrate was concentrated under reduced pressure to yield 3-(aminomethyl)-1-(1,1-diphenylmethyl)azetidine as a white solid (5.2 g, 73%).

b) A mixture of 3-(aminomethyl)-1-(1,1-diphenylmethyl)azetidine (10.9 g, 43 mmol), formaldehyde (21.8 mL) and formic acid (21.8 mL) was stirred under reflux for one hour and then evaporated under reduced pressure. The

OPEN SOURCE

resulting residue was mixed with ice, basified with aqueous sodium hydroxyde 2N and extracted with dichloromethane. The organic solution was washed with water, brine, dried ($MgSO_4$) and evaporated under reduced pressure to yield [1- (1,1-diphenylmethyl)azetidin-3-ylmethyl]dimethylamine (10.4 g, 86%) as an oil.

δ ($CDCl_3$): 2.16 (6H, s), 2.44 (2H, d), 2.6-2.8 (4H, m), 3.38 (2H, t), 4.32 (1H, s), 7.1-7.3 (10 H, m).

c) Hydrogen chloride in methanol was added to a mixture of [1-(1,1-diphenylmethyl)azetidin-3-ylmethyl]dimethylamine (9.9 g, 35 mmol) in methanol (150 mL) until pH = 4. Palladium hydroxyde (1.5 g, 20%) was added and the resulting mixture hydrogenated at room temperature at 50 p.s.i. for 4 days. The mixture was filtered through Celite and the filtrate evaporated under reduced pressure to give the title compound (5.0 g, 76%) as a white solid.

δ ($DMSO-d_6$): 2.72 (6H, s), 3.2-4.1 (8H, m).

15 COMPOSITION EXAMPLE 1

20 50,000 capsules each containing 100 mg of active ingredient were prepared according to the following formulation:

Active ingredient	5 Kg
Lactose monohydrate	10 Kg
Colloidal silicone dioxide	0.1 Kg
Corn starch	1 Kg
Magnesium stearate	0.2 Kg

25 Procedure

The above ingredients were sieved through a 60 mesh sieve, and were loaded into a suitable mixer and filled into 50,000 gelatine capsules.

30 COMPOSITION EXAMPLE 2

50,000 Tablets each containing 50 mg of active ingredient were prepared from the following formulation:

	Active ingredient	2.5 Kg
	Microcrystalline cellulose	1.95 Kg
	Spray dried lactose	9.95 Kg
	Carboxymethyl starch	0.4 Kg
5	Sodium stearyl fumarate	0.1 Kg
	Colloidal silicon dioxide	0.1 Kg

Procedure

All the powders were passed through a screen with an
10 aperture of 0.6 mm, then mixed in a suitable mixer for 20 minutes and compressed into 300 mg tablets using 9 mm disc and flat bevelled punches. The disintegration time of the tablets was about 3 minutes.
